

❖ The Hammett Equation and Linear Free Energy Relationship

In this section, we will discuss the quantitative treatments of the effect of structure on reactivity i.e. how the resonance effect, field-effect, and steric effect impact the reaction rate in measurable numbers.

➤ The Hammett Equation

Consider an organic reaction is carried out on a substrate which can be denoted as XRY, X a variable substituent and Y is the reaction spot, and R represents the basic substrate structure. In this type of case, replacing X = H with X = CH₃ results in an increment in the rate of reaction up ten times. However, it is still a mystery what part of the rate enhancement comes from resonance effect, field-effect, or steric effect. To do so, it is reasonable to use compounds where one or two effects are so small that they simply can be neglected. Although it is the oversimplification of the problem, quantitative results can still be obtained. The Hammett equation is the first attempt to give numerical values for the quantitative treatment of structure on reactivity. Hammett proposed the equation for the cases of *m*- and *p*-XC₆H₄Y as given below.

$$\log \frac{k}{k_0} = \sigma \rho \quad (23)$$

where *k* and *k*₀ are the constant for the group X ≠ H and X = H; ρ and σ are the constants for reaction conditions and substituent X, respectively.

➤ Derivation of Hammett Equation

To derive the Hammett equation, we need to recall the quantitative relationship between the structure and reactivity first. To do so, we need to find some mathematical parameter that can be used to represent the combined magnitude of inductive and resonance effects of different substituents. This can be achieved by considering the hydrolysis of a series of different benzoic acids as given below.

Where X is a substituent at the *m*- or *p*-position and *K*_a is the dissociation constant. As expected, the dissociation constant was found to be different for differently substituted substrates.

Since an electron-withdrawing group will better stabilize the conjugate base (i.e., XC₆H₄COO⁻), resulting in a larger magnitude of *K*_a (lower *pK*_a). On the other hand, an electron-donating group will destabilize the conjugate base (i.e., XC₆H₄COO⁻), resulting in a smaller magnitude of *K*_a (higher *pK*_a). Therefore, we can say that the electronic effect (inductive plus mesomeric effect) of a substituent can be represented as the difference between the *pK*_a value of its benzoic acid derivative and the *pK*_a value of benzoic acid itself; mathematically, we can say

$$\sigma_X = \log(K_a) - \log(K_a)_0 = -p(K_a) + p(K_a)_0 \quad (25)$$

Where the parameter σ_X (or simply σ) is called as substituent constant; and was found for several different groups just subtracting its benzoic acid derivative's *pK*_a value from *pK*_a value of benzoic acid.

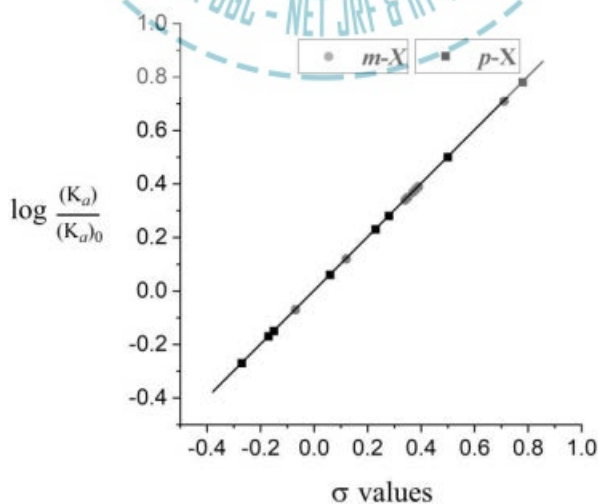

Table 1. pK_a values and substituent constants for $\text{XC}_6\text{H}_4\text{COOH}$ using benzoic acids $p(K_a)_0 = 4.21$.

Substituent	$p_m(K_a)$	$p_p(K_a)$	$\sigma_m = p(K_a)_0 - p_m(K_a)$	$\sigma_p = p(K_a)_0 - p_p(K_a)$
NO_2	3.50	3.43	0.71	0.78
CH_3	4.28	4.38	-0.07	-0.17
OCH_3	4.09	4.48	0.12	-0.27
$\text{CH}(\text{CH}_3)_2$	4.28	4.36	-0.07	-0.15
F	3.87	4.15	0.34	0.06
Br	3.82	3.98	0.39	0.23
Cl	3.84	3.98	0.37	0.23
I	3.86	3.93	0.35	0.28
COCH_3	3.83	3.71	0.38	0.50

Using $\log m - \log n = \log m/n$, equation (36) can also be written as

$$\log \frac{(K_a)}{(K_a)_0} = \sigma \quad (26)$$

Now if we plot a curve between $\log(K_a)/(K_a)_0$ vs σ , we will definitely get a straight line with a slope = 1.

Figure 17. Variation of $\log(K_a)/(K_a)_0$ vs σ for substituted benzoic acids.

Now we need to check if these σ values (i.e., of substituted benzoic acids) can also be used for other meta- or para-substituted benzene derivatives. To do so, consider two series of reactions; the first one is the acid dissociation of phenyl phosphonic acid, and the second one is the base hydrolysis of substituted ethyl benzoate. Here we will find if different substituents affect their dissociation constants or rates in the same manner as affected in the case of substituted benzoic acid. Also, we did not use ortho-substituents or substituents in the aliphatic system because they also contain steric factors and don't not linear variation.

The experimental $\log(K_a)/(K_a)_0$ for the reaction-I and experimental $\log k/k_0$ for reaction-II are given below.

Table 2. Experimental values of $\log(K_a)/(K_a)_0$ and $\log k/k_0$ for the acid dissociation of phenyl phosphonic acid and base hydrolysis of substituted ethyl benzoates, respectively.

Substituent	<i>meta</i> - $\log(K_a)/(K_a)_0$	<i>para</i> - $\log(K_a)/(K_a)_0$	<i>meta</i> - $\log k/k_0$	<i>para</i> - $\log k/k_0$
NO ₂	0.53	0.59	1.83935	2.06423
Br	0.29	0.23	–	–
Cl	0.28	0.17	0.88536	0.63347
CH ₃	–	–0.15	–0.16115	–0.34679
OCH ₃	–	–	–	–0.67923

When plotted the experimental $\log(K_a)/(K_a)_0$ for the reaction-I and experimental $\log k/k_0$ for reaction-II vs the substituent constants obtained for the substituted benzoic acids, we get the following curves.

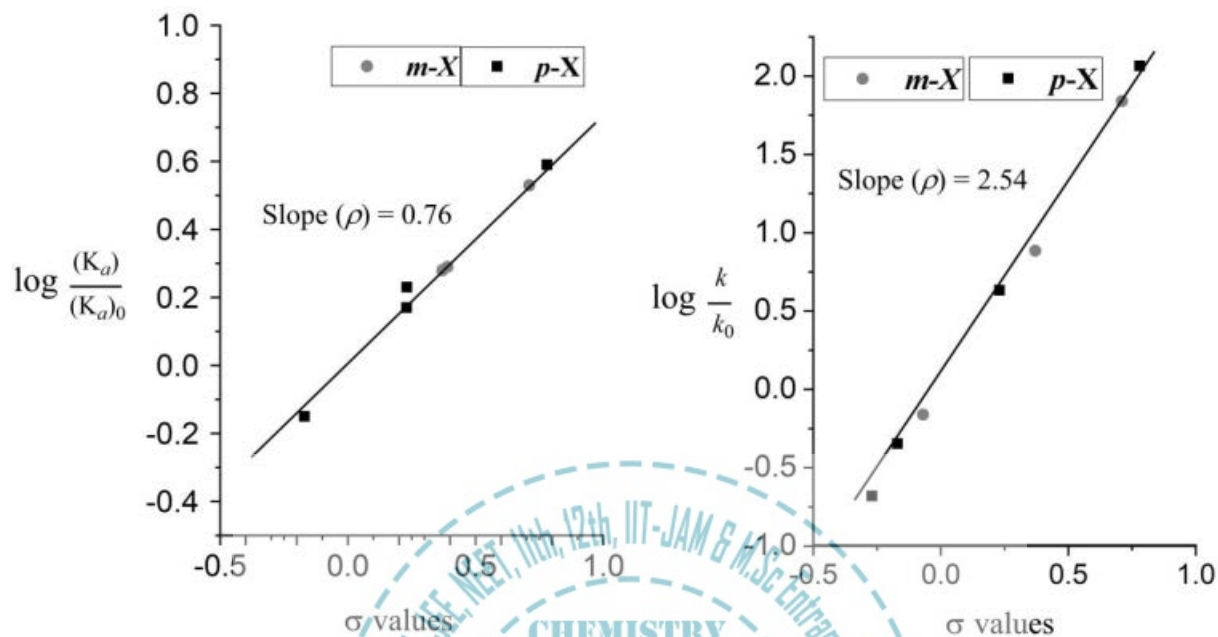

Figure 18. $\log(K_a)/(K_a)_0$ and $\log k/k_0$ vs σ for reaction-I and reaction-II.

It is obvious that the plots are still linear like in Figure 3 but the slope has changed. This implies that the order and relative effects for different substituents on both reactions remain the same though the magnitude has been changed which can be attributed to the different nature reaction considers from 'base reaction'.

Therefore, our aim, in this case, should be the determination of the slope (let us say ρ). Since on the vertical side we have ' $[\log(K_a)/(K_a)_0]_{sppa}$ ' for reaction-I (acid dissociation of phenyl phosphonic acid) and on the horizontal side we have ' σ or $[\log(K_a)/(K_a)_0]_{sba}$ ' for base reaction (hydrolysis of substituted benzoic acid), the slope should be

$$\rho = \frac{[\log(K_a)/(K_a)_0]_{seb}}{[\log(K_a)/(K_a)_0]_{sba}} \quad (27)$$

or

$$\rho[\log(K_a)/(K_a)_0]_{sba} = [\log(K_a)/(K_a)_0]_{seb} \quad (28)$$

But from equation (26), we know that $[\log(K_a)/\log(K_a)_0]_{sba} = \sigma$; and therefore, equation (40) takes the form

$$\left[\log \frac{(K_a)}{(K_a)_0} \right]_{seb} = \rho \sigma \quad (29)$$

For any reactions,

$$\log K_a = \rho\sigma - \log (K_a)_0 \quad (30)$$

Similarly, on the vertical side we have ‘ $\log k/k_0$ ’ for reaction-II (base hydrolysis of substituted ethyl benzoate) and on the horizontal side we have ‘ σ or $[\log(K_a)/(K_a)_0]_{sba}$ ’ for base reaction (hydrolysis of substituted benzoic acid), the slope should be

$$\rho = \frac{[\log k/k_0]_{seb}}{[\log(K_a)/(K_a)_0]_{sba}} \quad (31)$$

or

$$\rho[\log(K_a)/(K_a)_0]_{sba} = [\log k/k_0]_{seb} \quad (32)$$

But from equation (26), we know that $[\log(K_a)/\log(K_a)_0]_{sba} = \sigma$; and therefore, equation (32) takes the form

$$\left[\log \frac{k}{k_0} \right]_{sppa} = \rho\sigma \quad (33)$$

For any reactions,

$$\log k = \rho\sigma - \log k_0 \quad (34)$$

The results given by equation (29, 30, 33, 34) are called as Hammett's equations; which shows that the rates of ortho and para-substituted benzene derivatives can be obtained if the substituent contents for substituted benzoic acid are known. Now we will discuss the substituent and reaction constants in more detail

➤ Linear Free Energy Relationship (LFER)

The Hammett equation is a linear free energy relationship that can be proved for any group X by recalling the kinetics of organic reactions is in the framework of “Activated complex Theory”, which states that the rate constant (k) for a typical reaction is

$$k = \frac{RT}{Nh} e^{-\frac{\Delta G^*}{RT}} \quad (35)$$

Where ΔG^* is the free energy change of the activation step at temperature T. The symbols R , N , and h are the gas constant, Avogadro number, and Planck's constant, respectively. Similarly, for k_0 we have

$$k_0 = \frac{RT}{Nh} e^{-\frac{\Delta G_0^*}{RT}} \quad (36)$$

After putting the value of equation (35) and equation (36) in Hammett equation (23), we get

$$\log \frac{\frac{RT}{Nh} e^{-\frac{\Delta G^*}{RT}}}{\frac{RT}{Nh} e^{-\frac{\Delta G_0^*}{RT}}} = \sigma\rho \quad (37)$$

$$\log \frac{e^{-\frac{\Delta G^*}{RT}}}{e^{-\frac{\Delta G_0^*}{RT}}} = \sigma\rho \quad (38)$$

Multiplying both sides by 2.303, we have

$$2.303 \log \frac{e^{-\frac{\Delta G^*}{RT}}}{e^{-\frac{\Delta G_0^*}{RT}}} = 2.303 \sigma\rho \quad (39)$$

$$\ln \frac{e^{-\frac{\Delta G^*}{RT}}}{e^{-\frac{\Delta G_0^*}{RT}}} = 2.303 \sigma\rho \quad (40)$$

$$\ln e^{-\frac{\Delta G^*}{RT}} - \ln e^{-\frac{\Delta G_0^*}{RT}} = 2.303 \sigma\rho \quad (41)$$

or

$$\left(-\frac{\Delta G^*}{RT} \ln e\right) - \left(-\frac{\Delta G_0^*}{RT} \ln e\right) = 2.303 \sigma\rho \quad (42)$$

or

$$-\frac{\Delta G^*}{RT} + \frac{\Delta G_0^*}{RT} = 2.303 \sigma\rho \quad (43)$$

Which implies

$$\frac{\Delta G_0^*}{RT} - \frac{\Delta G^*}{RT} = 2.303 \sigma\rho \quad (44)$$

or

$$\frac{\Delta G_0^* - \Delta G^*}{RT} = 2.303 \sigma\rho \quad (45)$$

or

$$\Delta G_0^* - \Delta G^* = 2.303RT \sigma\rho \quad (46)$$

or

$$-\Delta G^* = 2.303RT \sigma\rho - \Delta G_0^* \quad (47)$$

Hence, the variation of negative of the free energy of activation varies linearly with slope $2.303RT\rho$ and $-\Delta G_0^*$ as intercept.

International
Edition

A TEXTBOOK OF ORGANIC CHEMISTRY

Volume I

MANDEEP DALAL

First Edition

DALAL INSTITUTE

Table of Contents

CHAPTER 1	11
Nature of Bonding in Organic Molecules	11
❖ Delocalized Chemical Bonding	11
❖ Conjugation	14
❖ Cross Conjugation	16
❖ Resonance	18
❖ Hyperconjugation	27
❖ Tautomerism	31
❖ Aromaticity in Benzenoid and Nonbenzenoid Compounds	33
❖ Alternant and Non-Alternant Hydrocarbons	35
❖ Huckel's Rule: Energy Level of π -Molecular Orbitals	37
❖ Annulenes	44
❖ Antiaromaticity	46
❖ Homoaromaticity	48
❖ PMO Approach	50
❖ Bonds Weaker Than Covalent	58
❖ Addition Compounds: Crown Ether Complexes and Cryptands, Inclusion Compounds, Cyclodextrins	65
❖ Catenanes and Rotaxanes	75
❖ Problems	79
❖ Bibliography	80
CHAPTER 2	81
Stereochemistry	81
❖ Chirality	81
❖ Elements of Symmetry	86
❖ Molecules with More Than One Chiral Centre: Diastereomerism	90
❖ Determination of Relative and Absolute Configuration (Octant Rule Excluded) with Special Reference to Lactic Acid, Alanine & Mandelic Acid	92
❖ Methods of Resolution	102
❖ Optical Purity	104
❖ Prochirality	105
❖ Enantiotopic and Diastereotopic Atoms, Groups and Faces	107
❖ Asymmetric Synthesis: Cram's Rule and Its Modifications, Prelog's Rule	113
❖ Conformational Analysis of Cycloalkanes (Upto Six Membered Rings)	116
❖ Decalins	122
❖ Conformations of Sugars	126
❖ Optical Activity in Absence of Chiral Carbon (Biphenyls, Allenes and Spiranes)	132
❖ Chirality Due to Helical Shape	137
❖ Geometrical Isomerism in Alkenes and Oximes	140
❖ Methods of Determining the Configuration	146

❖ Problems.....	151
❖ Bibliography.....	152
CHAPTER 3.....	153
Reaction Mechanism: Structure and Reactivity	153
❖ Types of Mechanisms.....	153
❖ Types of Reactions	156
❖ Thermodynamic and Kinetic Requirements.....	159
❖ Kinetic and Thermodynamic Control	161
❖ Hammond's Postulate.....	163
❖ Curtin-Hammett Principle	164
❖ Potential Energy Diagrams: Transition States and Intermediates	166
❖ Methods of Determining Mechanisms.....	168
❖ Isotope Effects	172
❖ Hard and Soft Acids and Bases.....	174
❖ Generation, Structure, Stability and Reactivity of Carbocations, Carbanions, Free Radicals, Carbenes and Nitrenes.....	176
❖ Effect of Structure on Reactivity	200
❖ The Hammett Equation and Linear Free Energy Relationship.....	203
❖ Substituent and Reaction Constants.....	209
❖ Taft Equation.....	215
❖ Problems.....	219
❖ Bibliography.....	220
CHAPTER 4.....	221
Carbohydrates	221
❖ Types of Naturally Occurring Sugars	221
❖ Deoxy Sugars	227
❖ Amino Sugars.....	229
❖ Branch Chain Sugars	230
❖ General Methods of Determination of Structure and Ring Size of Sugars with Particular Reference to Maltose, Lactose, Sucrose, Starch and Cellulose.....	231
❖ Problems.....	239
❖ Bibliography.....	240
CHAPTER 5.....	241
Natural and Synthetic Dyes	241
❖ Various Classes of Synthetic Dyes Including Heterocyclic Dyes	241
❖ Interaction Between Dyes and Fibers	245
❖ Structure Elucidation of Indigo and Alizarin	247
❖ Problems.....	252
❖ Bibliography.....	253
CHAPTER 6.....	254
Aliphatic Nucleophilic Substitution	254
❖ The S_N2 , S_N1 , Mixed S_N1 and S_N2 , S_Ni , S_N1' , S_N2' , S_N1'' and SET Mechanisms.....	254

❖ The Neighbouring Group Mechanisms.....	263
❖ Neighbouring Group Participation by π and σ Bonds	265
❖ Anchimeric Assistance	269
❖ Classical and Nonclassical Carbocations	272
❖ Phenonium Ions.....	283
❖ Common Carbocation Rearrangements.....	284
❖ Applications of NMR Spectroscopy in the Detection of Carbocations	286
❖ Reactivity – Effects of Substrate Structure, Attacking Nucleophile, Leaving Group and Reaction Medium	288
❖ Ambident Nucleophiles and Regioselectivity	294
❖ Phase Transfer Catalysis.....	297
❖ Problems.....	300
❖ Bibliography	301
CHAPTER 7	302
Aliphatic Electrophilic Substitution	302
❖ Bimolecular Mechanisms – SE_2 and SE_i	302
❖ The SE_1 Mechanism	305
❖ Electrophilic Substitution Accompanied by Double Bond Shifts	307
❖ Effect of Substrates, Leaving Group and the Solvent Polarity on the Reactivity	308
❖ Problems.....	310
❖ Bibliography	311
CHAPTER 8	312
Aromatic Electrophilic Substitution	312
❖ The Arenium Ion Mechanism.....	312
❖ Orientation and Reactivity	314
❖ Energy Profile Diagrams	316
❖ The Ortho/Para Ratio.....	317
❖ <i>ipso</i> -Attack	319
❖ Orientation in Other Ring Systems	320
❖ Quantitative Treatment of Reactivity in Substrates and Electrophiles	321
❖ Diazonium Coupling.....	325
❖ Vilsmeier Reaction	326
❖ Gattermann-Koch Reaction	327
❖ Problems.....	329
❖ Bibliography	330
CHAPTER 9	331
Aromatic Nucleophilic Substitution	331
❖ The $ArSN_1$, $ArSN_2$, Benzyne and S_RN_1 Mechanisms.....	331
❖ Reactivity – Effect of Substrate Structure, Leaving Group and Attacking Nucleophile.....	336
❖ The von Richter, Sommelet-Hauser, and Smiles Rearrangements	339
❖ Problems.....	343
❖ Bibliography	344

CHAPTER 10	345
Elimination Reactions	345
❖ The E ₂ , E ₁ and E ₁ CB Mechanisms	345
❖ Orientation of the Double Bond.....	348
❖ Reactivity – Effects of Substrate Structures, Attacking Base, the Leaving Group and The Medium	352
❖ Mechanism and Orientation in Pyrolytic Elimination.....	355
❖ Problems.....	358
❖ Bibliography.....	359
CHAPTER 11	360
Addition to Carbon-Carbon Multiple Bonds	360
❖ Mechanistic and Stereochemical Aspects of Addition Reactions Involving Electrophiles, Nucleophiles and Free Radicals.....	360
❖ Regio- and Chemoselectivity: Orientation and Reactivity	370
❖ Addition to Cyclopropane Ring	374
❖ Hydrogenation of Double and Triple Bonds	375
❖ Hydrogenation of Aromatic Rings.....	377
❖ Hydroboration	378
❖ Michael Reaction.....	379
❖ Sharpless Asymmetric Epoxidation	380
❖ Problems.....	382
❖ Bibliography	383
CHAPTER 12	384
Addition to Carbon-Hetero Multiple Bonds.....	384
❖ Mechanism of Metal Hydride Reduction of Saturated and Unsaturated Carbonyl Compounds, Acids, Esters and Nitriles	384
❖ Addition of Grignard Reagents, Organozinc and Organolithium Reagents to Carbonyl and Unsaturated Carbonyl Compounds.....	400
❖ Wittig Reaction.....	406
❖ Mechanism of Condensation Reactions Involving Enolates: Aldol, Knoevenagel, Claisen, Mannich, Benzoin, Perkin and Stobbe Reactions	411
❖ Hydrolysis of Esters and Amides.....	433
❖ Ammonolysis of Esters.....	437
❖ Problems.....	439
❖ Bibliography.....	440
